Four Questions, One Dataset

Each section below answers one question using the same cleaned dataset of 25,073 genre-level rows.

01

**Does volume buy
quality?**

Genre-level average rating vs.
number of titles produced.

02

**Is streaming still
growing?**

Title count by release year,
1990–2022, including pandemic
effect.

03

**Does popularity equal
quality?**

Average TMDB popularity score
vs. average rating, per genre.

04

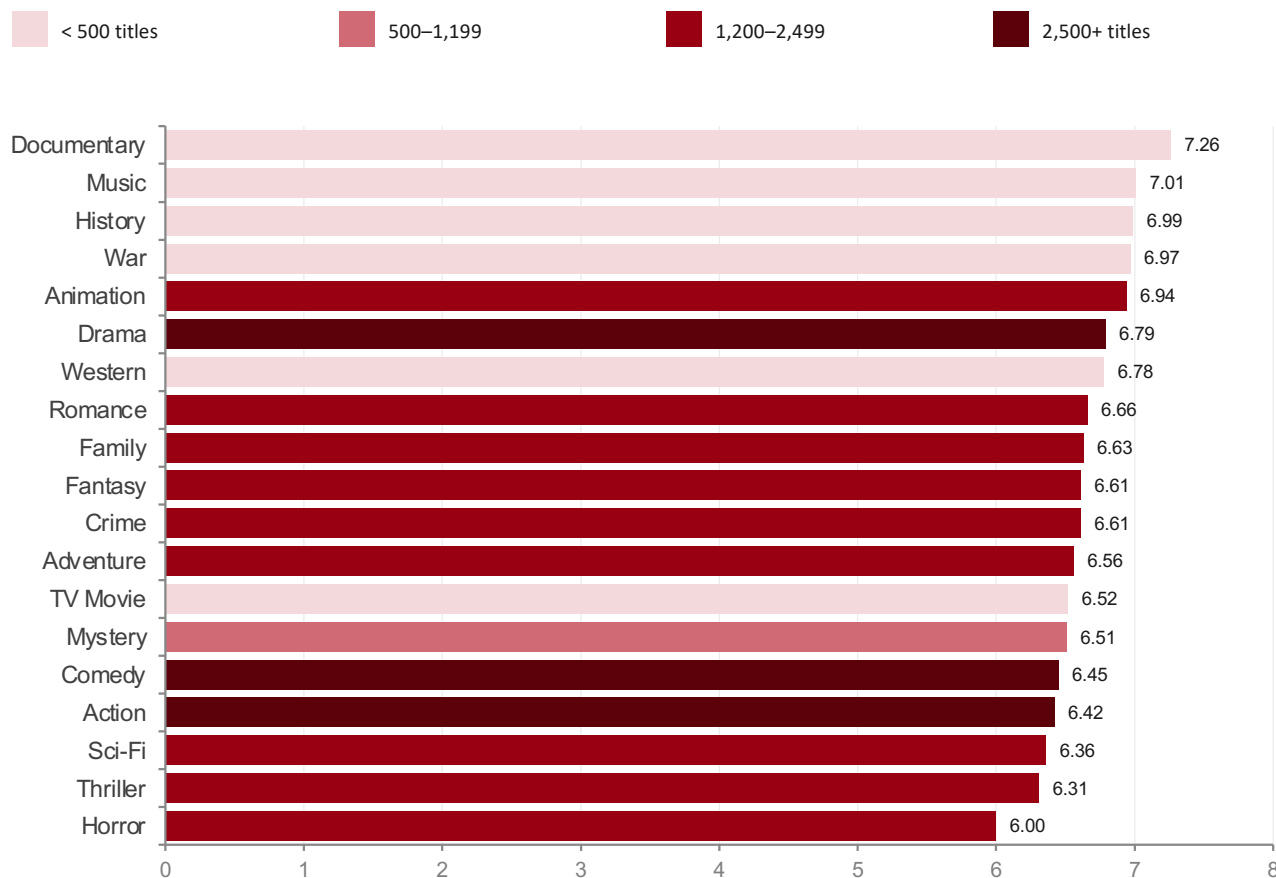

**Which language
performs best?**

Average rating across the 7
most common original
languages.

Volume Doesn't Buy Quality

Average rating by genre, ranked highest to lowest

BAR SHADE = TITLE COUNT

READING IT

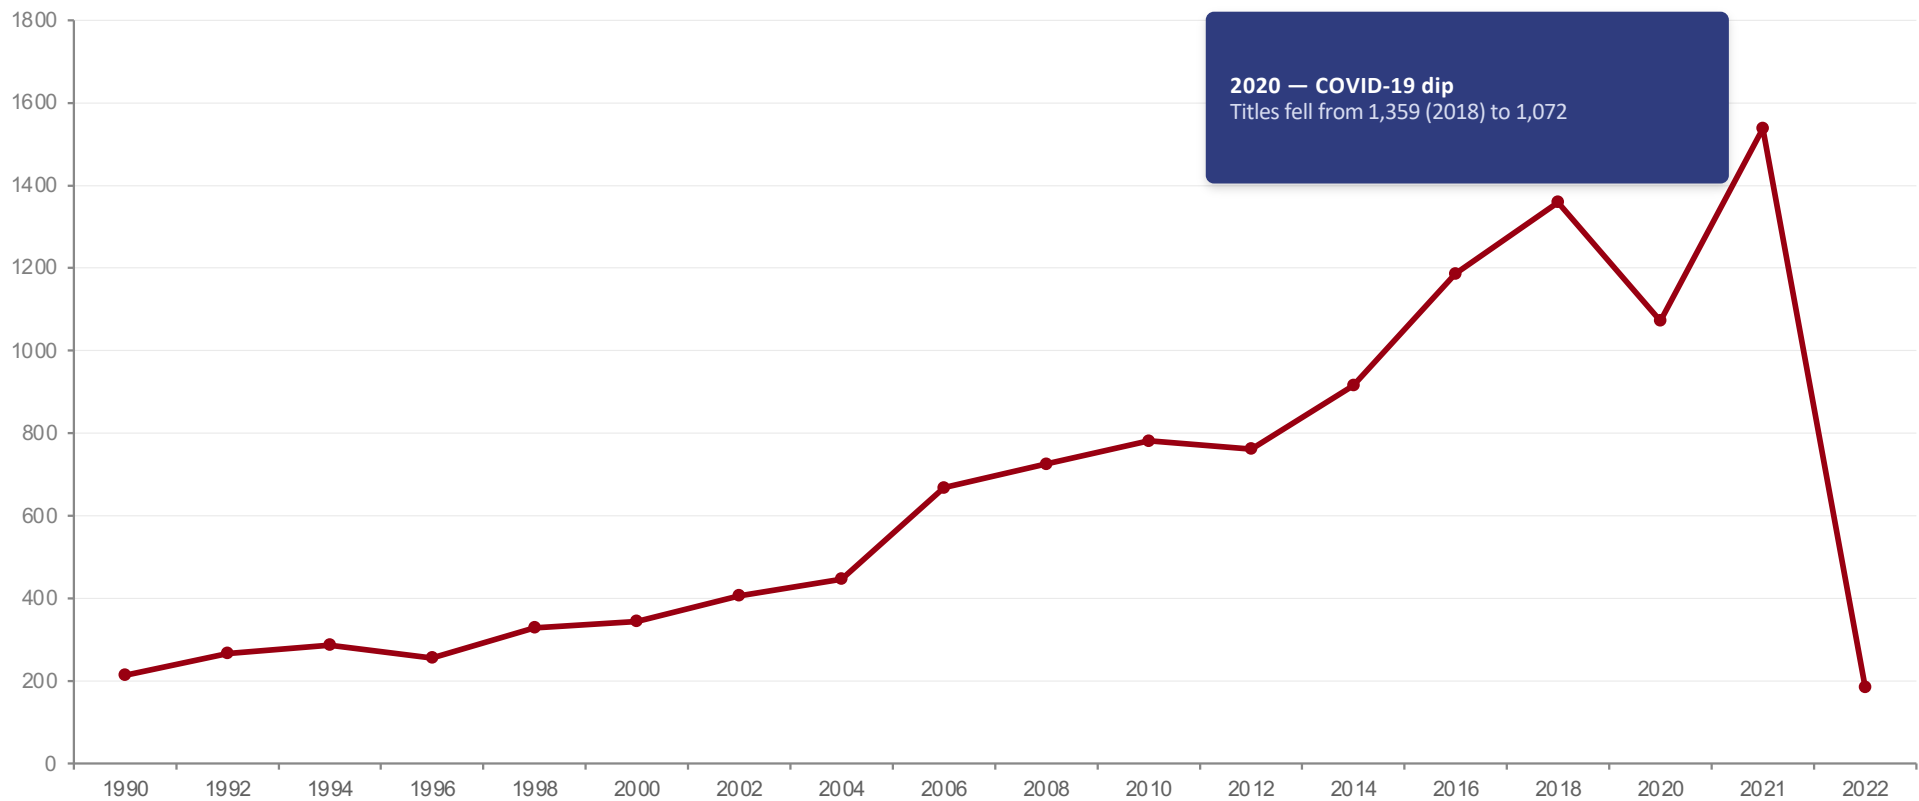

Documentary (7.26) and Music (7.01) top the rating chart — but the light shade gives it away: only 176 and 287 titles. The smallest sample sizes on the board.

Drama (3,617 titles) is the darkest bar by far — the volume leader — yet it sits mid-table at 6.79, not near the top.

Takeaway: the genres with the highest ratings are the ones produced least. Rating leadership and production volume don't move together.

Streaming Growth Has a Visible Scar

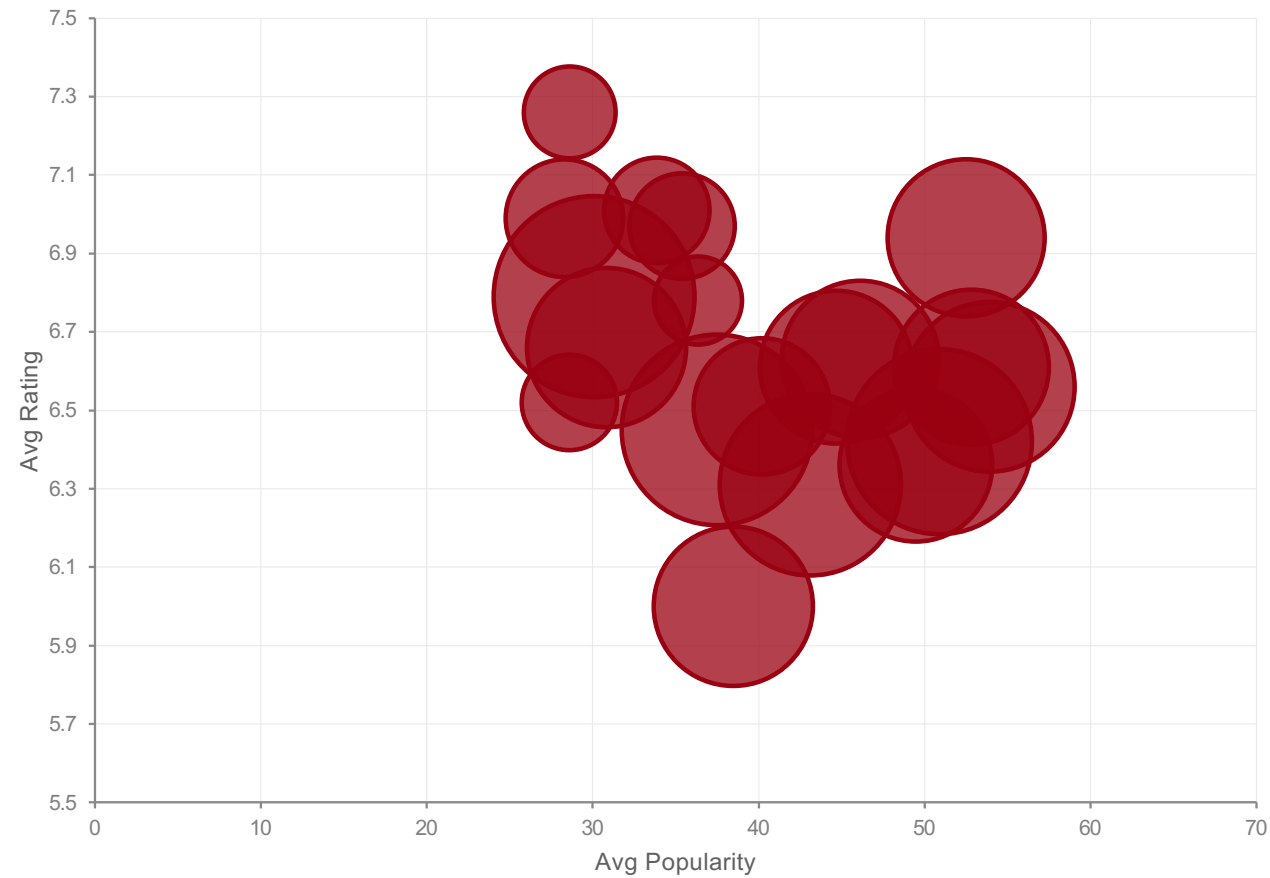

Titles released per year, 1990–2022

2022 reads low because the dataset's collection cutoff falls early in the year, not because output collapsed.

Popularity Is Not a Quality Signal

Average popularity vs. average rating, by genre — bubble size = title count

READING IT

No clean trend line.

Popularity (x-axis) and rating (y-axis) move mostly independently across genres.

Adventure and Fantasy

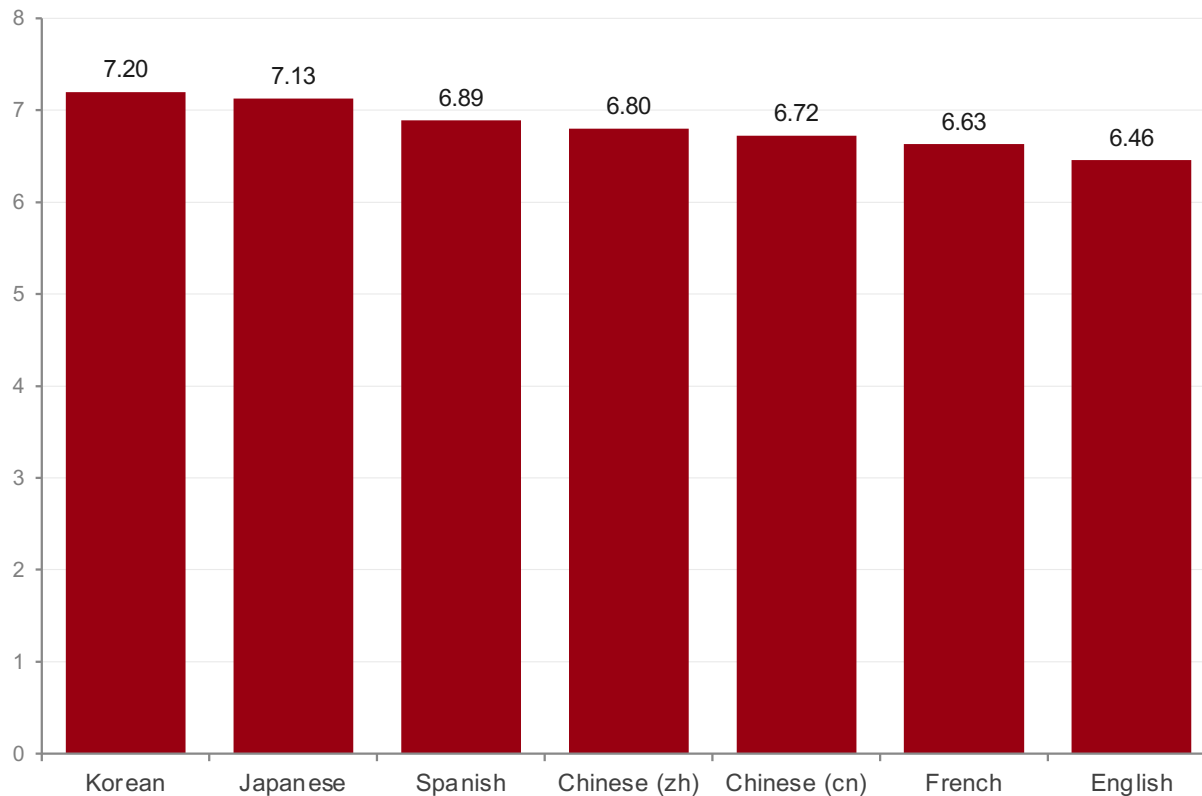

sit furthest right (most popular) but only mid-pack on rating.

Documentary

sits far left (least popular) yet has the highest average rating on the board.

Korean-Language Titles Lead on Rating

Average rating by original language, 7 most common languages in the dataset

WHY THIS MATTERS

Korean titles average 7.20

across 367 titles — the highest of any major language, ahead of English's 6.46 across 19,622 titles.

English carries the catalog's volume

(80%+ of all titles) but ranks last on average rating among the top 7 languages.

Business read:

expanding Korean and Japanese-language slates may lift average catalog quality more than adding English-language volume.

Three Takeaways

1

Quality and volume are different games.

Documentary and Music post the highest average ratings on a fraction of Drama's or Comedy's output. Catalog strategy built purely on volume caps out around the genre average — it doesn't lead it.

2

Popularity is a discovery metric, not a quality metric.

Genres with the highest average popularity (Adventure, Fantasy, Action) don't claim the highest average ratings. The two metrics should be tracked, and optimized, separately.

3

Language diversification has an upside beyond reach.

Korean and Japanese-language titles outrate the English-language catalog despite far smaller volume — a quality lever, not just a localization one.
